## Chapter 12 - The Mole

### 12.1 Avogadro's Number and the Mole

Avogadro's Number, $\mathbf{N}_{\mathbf{A}}$, is the amount of a substance in one mole of that same substance. Much like 12 is the amount in a dozen, $6.02 \times 10^{23}$ is the amount in a mole.

The mole is also defined as the number of carbon atoms in $\mathbf{1 2}$ grams of Carbon-12. So 1 mole of $\mathbf{C}$ atoms is $6.02 \times 10^{23}$ atoms $=12.01$ grams

## One mole $=6.02 \times 10^{23}$ entities

- These "entities" can be anything. Some common uses are:

$\Rightarrow$ The mole is used to compare two entities that have different masses. Once you have one mole of each, you now have $6.02 \times 10^{23}$ entities of each so you can now compare the two.

### 12.2 Molar Mass

If you were to count out $6.02 \times 10^{23}$ atoms of gold, Au, you would have one mole of gold. If you were to place this same one mole of gold on a balance to measure the mass it would weigh 196.97 grams.

$$
6.02 \times 10^{23} \text { atoms } \mathrm{Au}=1 \text { mole } \mathrm{Au}=196.97 \mathrm{~g} \mathrm{Au}
$$

This is the molar mass of gold, Au. The numbers from the periodic table represent the mass of one mole (or $6.02 \times 10^{23}$ atoms) of that element.
$\Rightarrow$ Recall atomic mass is average mass for one atom of an element. (units $=\mathrm{amu})$
Molar Mass - mass in grams of 1 mole of substance. (units $=\mathrm{g} / \mathrm{mol}$ )
$\Rightarrow$ Numerically same as atomic mass, but units are different.
Example 1: What is the molar mass of helium, He ?
Answer: The molar mass is $\mathbf{4 . 0 0} \mathbf{g} / \mathbf{m o l}$-This value comes from the Periodic Table.
Example 2: What is the molar mass of chlorine gas?
Answer: Since chlorine gas is a diatomic molecule, the formula is $\mathrm{Cl}_{2}$. There are two chlorine atoms in the molecule. Each Cl atom has a molar mass of $35.45 \mathrm{~g} / \mathrm{mol}$. Therefore the molar mass for $\mathrm{Cl}_{2}$ is $2(35.45 \mathrm{~g} / \mathrm{mol})=70.90 \mathrm{~g} / \mathbf{m o l}$

Example 3: What is the molar mass of water, $\mathrm{H}_{2} \mathrm{O}$ ?
Answer: $(2 \mathrm{H}$ atoms $\times 1.01 \mathrm{~g} / \mathrm{mol})+(1 \mathrm{O}$ atom $\times 16.00 \mathrm{~g} / \mathrm{mol})=\mathbf{1 8 . 0 2} \mathbf{~ g} / \mathbf{m o l}$

### 12.3 Mole Calculations

## Mole Calculations I:

> Avogadro's number is a useful conversion factor.

$$
\frac{6.02 \times 10^{23} \text { atoms }}{1 \text { mole }} \text { or } \frac{6.02 \times 10^{23} \text { molecules }}{1 \text { mole }}
$$

Example 1: Calculate the number of atoms in 3.56 moles of aluminum, Al.
Answer: $3.56 \mathrm{~mol} \mathrm{Al} \mathrm{x} \frac{6.02 \times 10^{23} \text { atoms Al }}{1 \mathrm{~mol} \mathrm{Al}}=\mathbf{2 . 1 4 \times 1 0} \mathbf{0}^{\mathbf{2 4}}$ atoms Al
Example 2: Calculate the number of moles of Mg when there is $5.77 \times 10^{24}$ atoms of Mg .
Answer: $5.77 \times 10^{24}$ atoms $\operatorname{Mg} \times \frac{1 \mathrm{~mol} \mathrm{Mg}}{6.02 \times 10^{23} \text { atoms } \mathrm{Mg}}=\mathbf{9 . 5 8} \mathbf{~ m o l ~ M g}$

## Mole Calculations II:

$>$ Molar Mass is also a useful conversion factor between grams to moles and moles to grams
$\Rightarrow$ Use the unit analysis method \& write molar mass as a fraction - make sure that the units cancel and give you the units that you are solving for.

Example 1: Calculate the number of water molecules in $2.50 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$.

Example 2: Calculate the mass of NaCl when there are $8.90 \times 10^{24}$ formula units of NaCl .
Answer: $8.90 \times 10^{24}$ formula units $\mathrm{NaCl} \times \frac{1 \mathrm{~mol} \mathrm{NaCl}}{6.02 \times 10^{23} \text { formula units } \mathrm{NaCl}} \times \frac{58.44 \mathrm{~g} \mathrm{NaCl}}{1 \mathrm{~mol} \mathrm{NaCl}}=\mathbf{8 6 4} \mathbf{~ g ~ N a C l}$

### 12.4 Molar Volume

Avogadro's Law: An equal number of gas molecules at the same temperature and pressure will occupy the same volume.
$\Rightarrow$ Molar volume is the volume occupied by 1 mole of a gas at a given temperature and pressure.
STP conditions: Standard Pressure $=1 \mathrm{~atm}$, Standard Temperature $=\mathrm{O}^{\circ} \mathrm{C}$

## At STP, 1 mole of ANY gas occupies 22.4 L

Write 2 unit factors for the molar volume at STP:

$$
\frac{22.4 \mathrm{~L}}{1 \mathrm{~mole}} \quad \text { or } \quad \frac{1 \text { mole }}{22.4 \mathrm{~L}}
$$

Example: Calculate the volume, in L , of 5.00 g of oxygen gas at STP.
Answer: Oxygen gas is $\mathrm{O}_{2}$. The molar mass for $\mathrm{O}_{2}$ is $2(16.00 \mathrm{~g} / \mathrm{mol})=32.00 \mathrm{~g} / \mathrm{mol}$

$$
5.00 \mathrm{~g} \mathrm{O}_{2} \times \frac{1 \text { mole } O_{2}}{32.00 g O_{2}} \times \frac{22.4 L O_{2} @ S T P}{1 \text { mole } O_{2} @ S T P}=3.50 \mathrm{~L} \mathrm{O}_{2} \text { gas @ STP }
$$

## $\Rightarrow$ Gas Density

$>$ Gas densities are about 1000 times lower than densities for solids and liquids
$>$ The densities for gases are often reported in grams per liter (g/L).
$\Rightarrow$ Can use molar mass and volume to find density at STP:
Density of a gas: $\mathbf{d}=$ mass $/$ volume $=$ Molar Mass $/$ Molar Volume

## Summary of mole calculations:

### 12.5 Percent Composition

Percent Composition is the mass \% of each element in a compound. For example $\mathrm{H}_{2} \mathrm{O}$ is $11.2 \%$ hydrogen and $88.79 \%$ oxygen. These percentages are true always, regardless of where the water came from. To calculate you assume you have one mole of the compound. You add up the molar mass of the compound the mass of one mole in grams. You then divide the molar mass of each element in the compound by the total molar mass of the compound.
$\Rightarrow$ Recall: Percent $\%=\frac{\text { Part }}{\text { Whole }} \times 100$

- The part is the molar mass of the individual element.
- The whole is the molar mass of the entire compound.

Example: Calculate the percent composition for H and O in water.
Answer: Water is $\mathrm{H}_{2} \mathrm{O}$. Molar mass of the two H 's is 2.02 grams $/ \mathrm{mol}$. Molar mass of the one oxygen is $16.00 \mathrm{grams} / \mathrm{mol}$. And the total compound has a molar mass of $18.02 \mathrm{grams} / \mathrm{mol}$.
$\% \mathrm{H}=\frac{2.02 \mathrm{~g} \mathrm{H}}{18.02 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}} \times 100=11.2 \% \mathrm{H} \quad \% \mathrm{O}=\frac{16.00 \mathrm{~g} \mathrm{O}}{18.02 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}} \times 100=88.79 \% \mathrm{O}$
You can check yourself: Note that $11.2+88.79$ is $100 \%$. (99.99)

## CHAPTER 12 PRACTICE PROBLEMS

1. How many atoms are in 10.0 moles of Pb ?
2. How many moles of C atoms are present in a sample of $1.25 \times 10^{24} \mathrm{C}$ atoms?
3. Calculate the molar masses of $\mathrm{NaCl}, \mathrm{CO}_{2}, \mathrm{~K}_{2} \mathrm{SO}_{4}$, and $\left(\mathrm{NH}_{4}\right)_{3} \mathrm{PO}_{4}$.
4. What is the mass in grams of 0.0235 moles of Na ?
5. What is the mass in grams of 3.75 moles of $\mathrm{FeCl}_{3}$ ?
6. How many moles are in 12.6 grams of $\mathrm{H}_{2} \mathrm{O}$ ?
7. Find the density of $\mathrm{N}_{2}$ gas at STP.
8. Find the density of $\mathrm{CO}_{2}$ gas at STP.
9. Find the volume in Liters for $0.500 \mathrm{~g} \mathrm{O}_{2}$ gas at STP.
10. Find the mass in grams for $1.5 \mathrm{~L}^{\text {of }} \mathrm{NO}_{2}$ gas at STP
11. Calculate the percent composition for $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{8}$.

## Answers to Practice Problems

1. $\frac{10.0 \text { moles } \mathrm{Pb}}{1} \times \frac{6.02 \times 10^{23} \mathrm{~Pb} \text { atoms }}{1 \text { mole } \mathrm{Pb}}=6.02 \times 10^{24} \mathrm{~Pb}$ atoms
2. $\frac{1.25 \times 10^{24} \mathrm{C} \text { atoms }}{1} \times \frac{1 \text { mole C }}{6.02 \times 10^{23} \mathrm{C} \text { atoms }}=2.08$ moles C
3. $\mathrm{NaCl}: \quad 1(22.99 \mathrm{~g} / \mathrm{mol})+\mathbf{1}(\mathbf{3 5 . 4 5} \mathbf{g} / \mathbf{m o l})=58.44 \mathrm{~g} / \mathrm{mol}$
$\mathrm{CO}_{2}: \quad 1(12.01 \mathrm{~g} / \mathrm{mol})+2(16.00 \mathrm{~g} / \mathrm{mol})=44.01 \mathrm{~g} / \mathrm{mol}$
$\mathrm{K}_{2} \mathrm{SO}_{4}: \quad 2(39.10 \mathrm{~g} / \mathrm{mol})+\mathbf{1}(32.07 \mathrm{~g} / \mathrm{mol})+4(16.00 \mathrm{~g} / \mathrm{mol})=174.27 \mathrm{~g} / \mathrm{mol}$ $\left(\mathrm{NH}_{4}\right)_{3} \mathrm{PO}_{4}: 3(14.01 \mathrm{~g} / \mathrm{mol})+12(1.01 \mathrm{~g} / \mathrm{mol})+1(30.97 \mathrm{~g} / \mathrm{mol})+4(16.00 \mathrm{~g} / \mathrm{mol})=149.12 \mathrm{~g} / \mathrm{mol}$
4. $\frac{0.0235 \mathrm{~mol} \mathrm{Na}}{1} \times \frac{22.99 \mathrm{~g} \mathrm{Na}}{1 \mathrm{~mol} \mathrm{Na}}=0.540 \mathrm{~g} \mathrm{Na}$
5. $\frac{3.75 \mathrm{~mol} \mathrm{FeCl}_{3}}{1} \times \frac{162.20 \mathrm{~g} \mathrm{FeCl}_{3}}{1 \mathrm{~mol} \mathrm{FeCl}_{3}}=608 \mathrm{~g} \mathrm{FeCl}_{3}$
6. $\frac{12.6 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}}{1} \times \frac{1 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}}{18.02 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}}=0.699 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}$
7. $d \mathrm{~N}_{2}=\left(\frac{28.02 \mathrm{~g} \mathrm{~N}_{2}}{\mathrm{~mol} \mathrm{~N}_{2}}\right)\left(\frac{\mathrm{mol} \mathrm{N}_{2}}{22.4 \mathrm{LN}_{2}}\right)=1.25 \mathrm{~g} / \mathrm{L} \mathrm{N} \mathrm{N}_{2}$
8. $d \mathrm{CO}_{2}=\left(\frac{44.01 \mathrm{~g} \mathrm{CO}_{2}}{\mathrm{~mol} \mathrm{CO}} 2\right)\left(\frac{\mathrm{mol} \mathrm{CO}_{2}}{22.4 \mathrm{LCO}_{2}}\right)=1.96 \mathrm{~g} / \mathrm{L} \mathrm{CO}_{2}$
9. $\quad\left(\frac{0.500 \mathrm{~g} \mathrm{O}_{2}}{1}\right)\left(\frac{\mathrm{mol} \mathrm{O}_{2}}{32.00 \mathrm{~g} \mathrm{O}_{2}}\right)\left(\frac{22.4 \mathrm{LO}_{2}}{1 \mathrm{~mol} \mathrm{O}_{2}}\right)=0.350 \mathrm{~L} \mathrm{O}_{2}$
10. $\left(\frac{1.5 \mathrm{LNO}_{2}}{1}\right)\left(\frac{\mathrm{mol} \mathrm{NO}_{2}}{22.4 \mathrm{LNO}_{2}}\right)\left(\frac{46.01 \mathrm{~g} \mathrm{NO}_{2}}{\mathrm{~mol} \mathrm{NO}}{ }_{2}\right)=3.1 \mathrm{~g} \mathrm{NO}_{2}$
11. $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{8}$ has a molar mass of 292.28 grams. The $\%$ are $41.09 \% \mathrm{C}, 5.53 \% \mathrm{H}, 9.587 \% \mathrm{~N}$, and $43.79 \% \mathrm{O}$.
