

### CHM 130: Chapter 14 Blackboard Homework Answers

- 1) Check all of the statements below that are **true**:
  - b) The solubility of a gas in a liquid decreases as temperature increases.
  - c) The solubility of a solid in a liquid increases as temperature increases.
  - e) The solubility of a gas in a liquid increases as the partial pressure of the gas above the liquid increases.
- 2) The "like dissolves like" rule indicates which of the following:
  - a) A nonpolar solid will dissolve in a nonpolar solvent.
  - b) A polar solid will dissolve in a polar solvent.
  - e) A nonpolar liquid is miscible with a nonpolar solvent.
  - f) A polar liquid is miscible with a polar solvent.

**Explanation:** The "like dissolves like" rule indicates that like substances will mix with or dissolve in one another.

- 3) Check all of the statements below that are **true**:
  - d) An ionic compound will never dissolve in a nonpolar solvent.
  - e) Check the Solubility Rules to determine if a particular ionic compound dissolves in a polar solvent.
- 4) Check all of the substances below that are soluble in or miscible with water:
  - a) ammonia,  $\text{NH}_3$  (l)
  - c) ethanol,  $\text{C}_2\text{H}_5\text{OH}$  (l)
  - f)  $\text{Li}_2\text{CO}_3$
  - h)  $\text{Sr}(\text{OH})_2$

**Explanation:** Polar molecules will be soluble in or miscible with water. Thus, the following polar molecules will be soluble in or miscible with water:  $\text{NH}_3$  (l) and  $\text{C}_2\text{H}_5\text{OH}$  (l).

Some ionic compounds will be soluble in water. From the Solubility Rules the following ionic compounds are soluble in water:  $\text{Li}_2\text{CO}_3$  and  $\text{Sr}(\text{OH})_2$ . The other ionic compounds ( $\text{PbCl}_2$  and  $\text{BaCO}_3$ ) are insoluble in water.

Nonpolar molecules are never soluble in or miscible with water. Thus, the following nonpolar molecules are not soluble in or miscible with water: vegetable oil,  $\text{C}_5\text{H}_{12}$  (l) and iodine,  $\text{I}_2$  (s).

- 5) Check all of the substances below that are soluble in or miscible with bromine,  $\text{Br}_2$  (l):
  - b) vegetable oil
  - e) pentane,  $\text{C}_5\text{H}_{12}$  (l)
  - g) iodine,  $\text{I}_2$  (s)

**Explanation:** Bromine is a nonpolar solvent. Only nonpolar molecules will be soluble in or miscible with bromine. Thus, only the following nonpolar molecules will be soluble in or miscible with bromine:  $\text{C}_5\text{H}_{12}$  (l), vegetable oil, and  $\text{I}_2$  (s).

**Ionic compounds and polar molecules will never be soluble in or miscible with nonpolar compounds like bromine.** Thus, the following ionic compounds and polar molecules will not be soluble in or miscible with bromine:  $\text{NH}_3$  (l),  $\text{C}_2\text{H}_5\text{OH}$  (l),  $\text{PbCl}_2$ , and  $\text{Li}_2\text{CO}_3$ .

- 6) Check all of the statements that will **increase the rate of dissolving** sugar in water:
  - a) Shaking the solution. (This is similar to stirring the solution.)
  - c) Using boiling water. (This is similar to heating the solution.)
- 7) Putting a few packets of sugar in a glass of iced tea and stirring the solution still leaves undissolved sugar crystals at the bottom of the glass. The iced tea is now \_\_\_\_\_ solution because it now holds the maximum amount of sugar it can hold at that temperature.
  - b) a saturated
- 8) Dissolving the maximum amount of solid that can be dissolved in a solvent at a higher temperature then allowing the solution to cool without disturbing it will result in \_\_\_\_\_ solution. The excess solid dissolved in the solution will recrystallize if disturbed at the lower temperature.
  - c) a supersaturated.
- 9) Putting a few granules of sugar in a glass of iced tea and stirring the solution results in \_\_\_\_\_ solution because the solution can hold more sugar than it currently holds.
  - a) an unsaturated

- 10) Calculate the mass percent concentration for 15.0 g of  $\text{CaCl}_2$  dissolved in 250.0 g of solution.

$$\text{Mass percent concentration} = \frac{\text{mass of solute}}{\text{mass of solution}} \times 100\% = \frac{15.00 \text{ g CaCl}_2}{250.0 \text{ g solution}} \times 100\% = 6.00\% \text{ CaCl}_2$$

11) Calculate the mass percent concentration for 7.50 g of KBr in 100.0 g of water.

$$\text{Mass percent concentration} = \frac{\text{mass of solute}}{\text{mass of solution}} \times 100\% = \frac{\text{mass of solute}}{\text{mass of solute} + \text{mass of solvent}} \times 100\%$$

$$\frac{7.50 \text{ g of KBr}}{7.50 \text{ g of KBr} + 100.0 \text{ g water}} \times 100\% = \frac{7.50 \text{ g of KBr}}{107.5 \text{ g solution}} \times 100\% = \mathbf{6.98\% \text{ KBr}}$$

12) What mass of water is present in 100 g of a 5.00% NaCl solution? (100 g solution – 5.00 g NaCl = 95.00 g water)

Assuming 100 g of solution, a 5.00% NaCl solution contains 5.00 g NaCl and 95.00 g water.

13) What mass of solute is present in 75.0 g of a 5.00% HNO<sub>3</sub> (aq) solution

Assuming 100 g of solution, a 5.00% HNO<sub>3</sub> solution contains 5.00 g HNO<sub>3</sub> and 95.00 g water.

$$75.0 \text{ g solution} \times \frac{5.00 \text{ g HNO}_3 \text{ solution}}{100 \text{ g solution}} = \mathbf{3.75 \text{ g HNO}_3}$$

14) What mass of solution contains 15.0 g of solute in a 5.25% KOH solution?

Assuming 100 g of solution, a 5.25% KOH solution contains 5.25 g KOH and 94.75 g water.

$$15.0 \text{ g of KOH} \times \frac{100 \text{ g solution}}{5.25 \text{ g KOH}} = \mathbf{286 \text{ g solution}}$$

15) What mass of water is required to dissolve 25.0 g of NaCl to prepare a 5.00% NaCl solution?

Assuming 100 g of solution, a 5.00% NaCl solution contains 5.00 g NaCl and 95.00 g water.

$$25.0 \text{ g solution} \times \frac{95.00 \text{ g water}}{5.00 \text{ g NaCl}} = \mathbf{475 \text{ g water}}$$

16) Calculate the molarity (or molar concentration) for a solution prepared by dissolving 0.500 moles of NaCl to make 2.00 L of solution.

Molarity (or molar concentration) is the moles of solute per liter of solution. Thus, to solve for molarity of NaCl (shown as [NaCl]), put moles of solute in the numerator and liters of solution in the denominator:

$$[\text{NaCl}] = \frac{0.500 \text{ moles NaCl}}{2.00 \text{ L}} = \mathbf{0.250 \text{ M NaCl}}$$

17) Calculate the molarity (or molar concentration) for a solution prepared by dissolving 25.0 g of NaOH to make 1.50 L of solution.

$$25.0 \text{ g NaOH} \times \frac{\text{moles NaOH}}{40.00 \text{ g NaOH}} = 0.625 \text{ moles NaOH}$$

$$[\text{NaOH}] = \frac{0.625 \text{ moles NaOH}}{1.50 \text{ L}} = \mathbf{0.417 \text{ M NaOH}}$$

18) Calculate the molarity (or molar concentration) for a solution prepared by dissolving 50.0 of KBr to make 500.0 mL of solution.

$$50.0 \text{ g KBr} \times \frac{\text{mole KBr}}{119.00 \text{ g KBr}} = 0.420 \text{ moles KBr} \quad 500.0 \text{ mL} \times \frac{1 \text{ L}}{1000 \text{ mL}} = 0.5000 \text{ L}$$

$$[\text{KBr}] = \frac{0.420 \text{ moles KBr}}{0.5000 \text{ L}} = \mathbf{0.840 \text{ M KBr}}$$

19) Calculate the number of moles of NaOH present in 150.0 mL of a 1.25M NaOH solution.

$$150.0 \text{ mL} \times \frac{1 \text{ L}}{1000 \text{ mL}} \times \frac{1.25 \text{ moles NaOH}}{\text{L}} = \mathbf{0.188 \text{ moles NaOH}}$$

20) Calculate the mass of NaCl present in 250.0 mL of a 2.50 M NaCl solution.

$$250.0 \text{ mL} \times \frac{1 \text{ L}}{1000 \text{ mL}} \times \frac{2.50 \text{ moles NaCl}}{\text{L}} \times \frac{58.44 \text{ g NaCl}}{\text{mole NaCl}} = \mathbf{36.5 \text{ g NaCl}}$$
